ABSTRACT: Synthesis and analytical data for 2,4-dimethoxy-3-methylphenethylamine (2) and its hydrochloride salt (3) are described. 2 was synthesized from 2,4-dimethoxy-3-methylbenzaldehyde via trans-2,4-dimethoxy-3-methyl-\(\beta\)-nitrostyrene (1). The compounds were characterized by \(^1\)H NMR, \(^13\)C NMR, GC/MS, and FTIR. The data was compared to 2,5-dimethoxy-4-methylphenethylamine (2C-D).

KEYWORDS: Designer Drugs, Dimethoxyphenethylamines, Synthesis, Isomescaline, 2C-D, Desoxy, TIM, Forensic Chemistry

Introduction

A large number of phenethylamines derivatives are known, many of which have been reported to have CNS-stimulant and/or psychoactive properties.\(^1\) As a result, many phenethylamines compounds are listed as controlled substances. Notably, for each of these controlled substances are various possible isomers differing only in the positioning of the phenyl substituents. These positional isomers and analogues are (with few exceptions) not formally controlled; however, they may be prosecuted under the Analogue Statute of the Controlled Substances Act.

Examples of positional isomers that have circulated in the chemical underground are 2,5-dimethoxy-4-methylphenethylamine HCl (also known as “2C-D”) and 3,5-dimethoxy-4-methylphenethylamine HCl (also known as “DESOXY”).\(^1\) Recently, an exhibit containing 2C-D was received at this laboratory. Interestingly, the \(^1\)H NMR spectrum of 2C-D displays two singlets in the aromatic region that could potentially be confused for a doublet, albeit with a suspiciously large vicinal coupling constant (10 Hz). Trisubstituted phenethylamines may only form vicinally-derived doublets in the aromatic region if the phenyl substituents are arranged such that the two aromatic protons are \(\alpha\) to each other.

An example of an isomer of 2C-D having adjacent phenyl protons is 2,4-dimethoxy-3-methylphenethylamine HCl (3).\(^2\) While NMR spectral differences between 3 and 2C-D can be predicted, it was preferable to demonstrate these differences from actual data.

The synthesis of 2,4-dimethoxy-3-methyl-\(\beta\)-nitrostyrene (1), 2,4-dimethoxy-3-methylphenethylamine (2), and 3 was originally reported by Merchant, \textit{et al.}\(^2\) and is provided herein along with new spectroscopic data (Scheme 1). In addition, the analytical results are compared to those of the recently received 2C-D exhibit.

Experimental

Reagents: All reagents and solvents were obtained from commercial sources and unless otherwise noted were used as received. Tetrahydrofuran was dried with Na/benzophenone and distilled under nitrogen prior to use.

2,4-Dimethoxy-3-methyl-β-nitrostyrene (1-(2,4-dimethoxy-3-methylphenyl)-2-nitroethene) (1): To a nitromethane solution (30 mL) of anhydrous ammonium acetate (1.0 g, 13 mmol) was added 2,4-dimethoxy-3-methylbenzaldehyde (8.0 g, 44 mmol). The resulting mixture was stirred and heated for 20 minutes at light reflux. The solvent was then removed under reduced pressure (via rotary evaporator) while warming. The resulting orange solid was recrystallized from isopropanol, collected by vacuum filtration, and dried under vacuum (8.3 g, 85% yield). 

'H NMR (CDCl3, 400 MHz): δ 8.12 (d, J = 13.7 Hz, 1H), 7.72 (d, J = 13.7 Hz, 1H), 7.34 (d, J = 8.8 Hz, 1H), 6.69 (d, J = 8.6 Hz, 1H), 3.87 (s, 3H), 3.74 (s, 3H), 2.15 (s, 3H); 13C{'H} NMR (CDCl3, 100.6 MHz): δ 162.4, 159.8, 136.0, 135.5, 129.1, 121.0, 116.3, 106.8, 61.3, 55.9, 9.0 (11 signals expected and observed) ppm. FTIR (ATR, cm−1): 1621 (νaromatic), 1597 (νaromatic C–C str), 1334 (νNO2 Sym str), 1109 (νC=O, C=Sym str). FTIR (ATR, cm−1): 1622 (νC=C str), 1591 (νaromatic C–C str), 1336 (νNO2 Sym str), 1107 (νC=O, Sym str). GC/MS: Rel. Rt: 2.00 (relative to methamphetamine), m/z (assignment): 223 (M+), 176 (base peak).

2,4-Dimethoxy-3-methylphenethylamine (2): To a 500 mL round bottom flask was added 2.1 g LiAlH4 (56 mmol) and 70 mL dry THF. Under a nitrogen atmosphere for 7 hours. After cooling the reaction mixture to ambient temperature, an equal volume of water (130 mL) was added, with the initial addition being done drop wise to minimize the vigorous reaction. The reaction mixture was extracted with EtOAc (4 x 90 mL); each extract was dried with NaCl and filtered, and combined. Removal of the solvent under reduced pressure resulted in a pale yellow oil as the crude product. This oil was redissolved in 10 mL CH2Cl2 and extracted with several fractions (3 - 4 mL each) of aqueous HCl (pH 2-3) until the pH of the final aqueous fraction did not increase (the latter was discarded). The combined aqueous fractions were base extracted with 2 M NaOH and CH2Cl2. The organic layer was collected and removal of the solvent under reduced pressure yielded 1.3 g of a clear oil (58% yield). 

'H NMR (CDCl3, 400 MHz): δ 6.95 (d, J = 8.2 Hz, 2H), 6.57 (d, J = 8.4 Hz, 2H), 3.77 (s, 3H), 3.68 (s, 3H), 2.89 (t, J = 7.0 Hz, 2H), 2.69 (t, J = 7.0 Hz, 2H), 2.13 (s, 3H), 1.8 (br-s, N-H); 13C{'H} NMR (CDCl3, 100.6 MHz): δ 157.5, 157.2, 127.2, 124.5, 119.6, 106.0, 60.6, 55.5, 43.1, 34.0, 9.1 (11 signals expected and observed) ppm. FTIR (neat/NaCl, cm−1): 3366 (νNH str), 3296 (νNH str), 1602 (νNH bend), ~1590 (sh, varomatic C–C str), 1268 (νC=O str), 1109 (νC=O, Sym str). FTIR (ATR, cm−1): 3371 (νNH str), 3289 (νNH str), 1601 (νNH bend), ~1590 (sh, vvaromatic C=C str), 1268 (νC=O, str), 1103 (νC=O, Sym str). GC/MS: Rel. Rt: 1.57 (relative to methamphetamine), m/z (assignment): 195 (M+), 166 (base peak).
Results and Discussion

Synthesis of 1 involved a condensation/dehydration of the precursor 2,4-dimethoxy-3-methylbenzaldehyde with nitromethane in the presence of ammonium acetate (Scheme 1). Recrystallization from isopropanol provided yellow crystals of 1 in good yield. The mass spectrum of 1 (Figure 1) is consistent with its structure.

The $^1$H NMR spectrum of 1 (Figure 2) is consistent with formation of the expected, more stable trans isomer as evidenced by downfield chemical shifts and relatively large vicinal coupling constants compared to those typically found in the cis counterparts. The coupling constants for the alkene protons are slightly depressed with respect to comparable trans compounds due to the added electron-withdrawing effect of the nitro group.

The IR (Figures 3 and 4) spectral assignments also support the trans isomer of 1 based upon the work of By et al. (wherein related $\beta$-methyl-$\beta$-nitrostyrenes were compared and characterized by IR/Raman spectroscopy). Notably, the lower frequency for the ethylenic C=C stretching mode of 1, compared to the $\beta$-methyl-$\beta$-nitrostyrenes, can be accounted for by increased conjugation with the aromatic ring in the absence of the sterically hindering $\beta$-methyl group, allowing for a more planar conformation. On the other hand, the higher frequency observed for the symmetric NO$_2$ stretching band of 1 can be explained by the absence of the electron donating $\beta$-methyl group.

The free base form of 2 was obtained from reduction of 1 with LiAlH$_4$ in dry THF under an inert atmosphere (Scheme 1). The crude oily product obtained after work up of the reaction mixture was shown to contain minor amounts of impurities. Surmising that the desired product might have differing pKa value(s) from those of the impurities, 2 was successfully isolated by acid extraction with careful control of pH, followed by basic extraction. The MS, FTIR, $^1$H NMR spectra (Figures 5, 6, and 7, respectively) were consistent with the formation of 2.

Conversion of 2 to its hydrochloride salt was done from an isopropanolic solution mixed with a small amount of concentrated hydrochloric acid and diethyl ether, yielding a white, crystalline solid (Scheme 1) of 3. The IR spectra of 3 (Figures 8 and 9) are complicated by the broad and numerous bands displayed, particularly in the region between 3500 - 2000 cm$^{-1}$, as is expected for hydrated primary amine salts.

The $^1$H NMR spectrum (Figure 10) exhibits a broad peak for the protonated amine at 8.32 ppm. Despite extensive drying of the crystalline material under vacuum, a water peak is still observed at ~1.7 ppm, likely due to the inclusion of a hydrogen bonded water molecule in the crystalline lattice of 3, suggesting the formation of a hydrate complex upon crystallization. Addition of 1 - 2 drops CD$_3$OD to a CDCl$_3$ solution of 3 results in a shift of the H$_2$O peak downfield ~1.5 ppm as CD$_3$OH is formed. In CD$_3$OD, the $^1$H NMR spectrum (Figure 11) of 3 lacks peaks for the exchangeable amino and water protons. Due to a reduced solubility relative to 2 in chloroform solution, the $^{13}$C NMR spectrum of 3 was obtained in deuterated methanol.

Not surprisingly, the FTIR and mass spectra of 3 and 2C-D are fairly similar. However, differences in the substitution patterns on the phenyl ring make these compounds readily distinguishable by $^1$H NMR, as displayed in the spectrum (Figure 12) of the 2C-D exhibit received into this lab. The most distinguishing features are the two singlets of the phenyl protons in the spectrum of 2C-D, at 6.69 and 6.66 ppm, whereas 3 displays two doublets at 7.00 and 6.57 ppm, respectively.

It should be noted that closely related analogues such as 2,3,4-trimethoxyphenethylamine (also known as “isomescaline”) and 2,4-dimethoxy-3-thiomethylphenethylamine (also known as “TIM”) have been reported to be “non-active” (that is, having no noticeable pharmacological effects on the user.1) The isostructural nature of 3 with these pharmacologically inactive compounds suggests that it is likewise inactive. However, because other dimethoxy/methyl-substituted phenethylamine isomers of 3 (e.g., 2C-D and DESOXY) are psychoactive, the situation is unclear. Regardless, these and other possible isomers can be readily distinguishable by NMR.
Acknowledgments

Notably, the concept for this project originated from former DEA Southeast Laboratory Director William D. Beazley. The author would like to thank Senior Forensic Chemist Patrick A. Hays, DEA Special Testing and Research Lab (Dulles, Virginia) for helpful information regarding the $^1$H NMR spectrum of 2C-D. Also, appreciation goes to DEA Librarian Rosemary Russo (Arlington, Virginia) for searching for and providing literature references.
